

## Motorola Razr 5G

The new Motorola Razr 5G promises to be a completely new version of its last year's predecessor in terms of performance. Flippable phones are back into action, now as foldable phones, bringing back the nostalgia from the beginning of this century. Although this cell phone may have many benefits from technological advances throughout the years, such as an innovative design, high performance cameras and different options for screen display, it is also mainly because of its design that there are also some setbacks, like a small battery and no room for an SD card for extra space for instance. Also, when talking about prices, this one is really expensive.

Pros	Cons
<ol style="list-style-type: none"><li>1. Compact design</li><li>2. High quality pictures and videos</li><li>3. Exterior screen display</li></ol>	<ol style="list-style-type: none"><li>1. Battery</li><li>2. No room for SD card</li><li>3. Price</li></ol>

The Razr's original design is what caught the public's attention at first glance. With a compact design, one can carry it in their pocket and not worry about it getting stolen so easily and might even forget that the device is there, as it only weighs 192g. Besides that, what the majority of people care about the most in a cell phone, is the quality of the camera. Nowadays many people work with their own image -- the so called influencers and youtubers -- and having a good camera resolution is of utmost importance. With a 48 megapixel camera, the Motorola Razr 5G is an excellent choice if you're looking for a good quality camera. Last but not least, perhaps one of its greatest improvements is the exterior screen display that can be used by some apps for a quick access, without having to flip open your phone.

Because of its small design, this device suffered some consequences regarding available space. The Razr 5G's battery is only a 2800 ampere one (much lower when compared to other devices), so you'll have to charge it more often. While this cell phone has a huge internal storage space (256GB), it does not give the customer the option to put an SD card to increase its storage, which might be a problem if you're downloading many different apps or keeping a lot of files. Apart from all the advantages and disadvantages you look for when buying a new phone concerning its performance, the real tiebreaker is always the price, and this phone is not a really good option if you want to save some money, as its launch price is about \$1,400.

Shopping for a new phone can be an arduous task, so it's important that you always look for the best offer, so that you won't have any regrets later. In regard to the new Motorola Razr 5G, its design and camera quality are greatly appealing, but considering the small capacity battery as well as its high price for a device like this, it wouldn't be a great deal to spend money on this phone right now.
